(2)

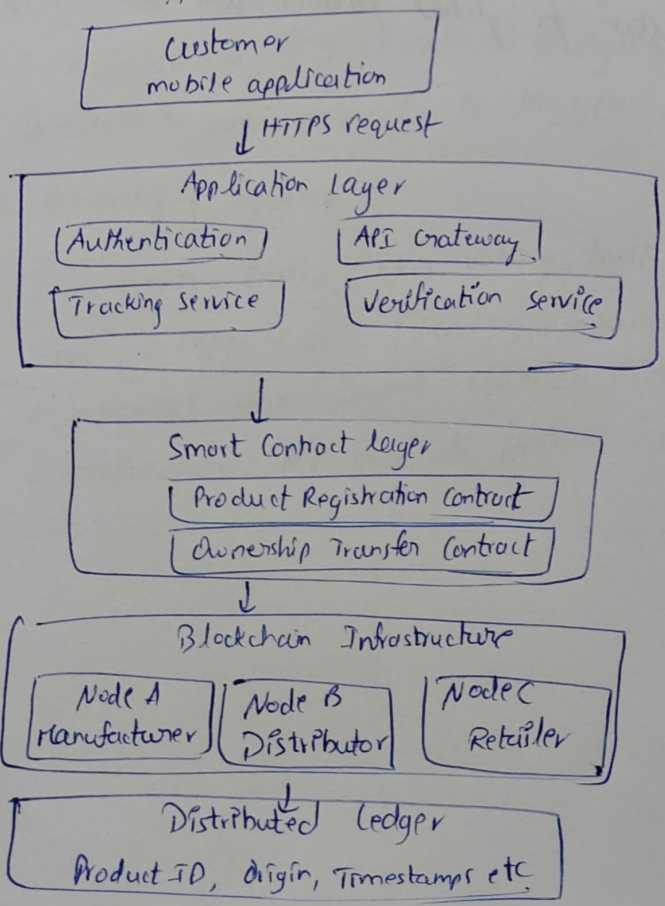

A) Land records contain information about land ownership, survey numbers, boundaries, transfers, and registration history.
Blockchain can provide a tamper-evident history of land transactions. However, land transfers must still comply with legal procedures and verified documents.

Suitable blockchain Type – Consortium blockchain

→ It is a permissioned blockchain governed by multiple approved organizations rather than a single authority or an unrestricted public network.

Suitable because:
1) Multiple departments can jointly govern the network.
2) Only authorized officials can submit or approve record updates.
3) The public can be granted read-only access to permitted information.
4) The identities of officials and transactions can be audited.

Architecture

Governance Challenge & Solution

Challenge	Solution
Disagreement b/w department	Establish a governance council with representatives from participating departments
Disputes over land ownership	Refer cases to the legally authorized revenue authority or court; record the final lawful decision
Incorrect Original Records	Conduct verification and reconciliation before migration to the blockchain.
